ophthalmological. The polynucleotides and polypeptides can be are used to copital prevent, treat or ameliorate a medical condition in e.g. humans, mice, crabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include cautoimmune diseases, hyperproliferative disorders, cardiovascular conditions caused by bacteria, viruses and fungi and ocular conditions caused by bacteria, viruses and fungi and ocular conditions caused by bacteria, viruses and fungi and ocular conditions. The polypeptides can also be used to aid wound healing and comparate tial colling and colling and comparate tial colling and colli
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           invention. Human secreted proteins have activities based on the tissues and cells the genes are expressed in Example of activities include: immunosuppressive; antiarthritic; antiheumatic; antiprolliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nootropic; neuroprotective; antibacterial; virucide; fungicide; and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     human secreted proteins given in AAB38119 to AAB38105. AAB38201 represent human secreted polypeptide sequences and proteins AAB38201 represent human secreted polypeptide sequences and proteins homologous to them, which are given in the exemplification of the prohomologous to them, which are given in the exemplification of the tigs!

The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to prevent skin aging due to sunburn, to maintain organs before transplantation, for supporting cell culture of primary tissues, to regenerate tissues and in chemotaxis. The polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC69390 to AAC69398 and AAB38118 represent sequences used in the exemplification of the polypeptides can also be used as a food additive or preservative to increase or decrease storage capabilities. AAC69390 to AAC69398 and AAB38118 represent sequences used in the exemplification of the properties.
                                                                                                                                                                                                                                                                                                                  gene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ophthalmological. The polynucleotides and polypeptides can be are used to prevent, treat or amelicrate a medical condition in e.g. humans, mice, rabbits, goats, horses, cats, dogs, chickens or sheep. They are also used in diagnosing a pathological condition or susceptibility to a pathological condition. Disorders which are diagnosed or treated include autoimmune diseases, hyperproliferative disorders, cardiovascular disorders, cardiovascular disorders, cerebrovascular disorders, angiogenesis, nervous system
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        and cells the genes are expressed in. Example of activities include: immunosuppressive; antiarthritic; antirheumatic; antiprolliferative; cytostatic; cardiant; vasotropic; cerebroprotective; nottropic; neuroprotective; antibacterial; virucide; fungicide; and

           The present sequence represents rat ninjurin 1 (nerve injury induced). The ninjurin protein (NP) plays a role in axonal regeneration of peripheral nervous system (PNS) neuronal cells after injury. The products can be used for developing products for treating ninjurin mediated disorders including conditions involving inappropriate (i.e.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is a polypeptide encoded by one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dr primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain formals, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors.
                                                                                                                                                                                               Claim

              The present sequence represents human ninjurin 1 (nerve injury induced). The ninjurin protein (NP) plays a role in axonal regeneration of peripheral nervous system (PNS) neuronal cells after injury. The products can be used for developing products for treating ninjurin mediated disorders including conditions involving inappropriate (i.e. excessive or insufficient) cellular abesion. Conditions involving excessive cellular adhesion which may be treated include e.g. inflammatory diseases such as rheumatoid arthritis, asthma, allergy conditions, adult respiratory distress syndrome, inflammatory bowel diseases (e.g. Crohn's disease, ulcerative colitis and regional enteritis) and ophthalmic inflammatory diseases, autoimmune diseases, thrombosis or inappropriate platelet aggregation conditions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   arterlosclerosis, reocclusion following thrombolysis, cardiovascu diseases, some forms of diabetes and neoplastic disease including metastasis conditions. The products can also be used to promote cellular adhesion, e.g. in nerve regeneration, wound healing or prosthetic implantation. The products can also be used for detect
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       excessive cellular adhesion which may be treated include e.g. inflammatory diseases such as rheumatoid arthritis, asthma, allergy conditions, adult respiratory distress syndrome, inflammatory bowel diseases (e.g. Crohn's disease, ulcerative colitis and regional enteritis) and ophthalmic inflammatory diseases, autoimmune diseases, thrombosis or inappropriate platelet aggregation conditions, arteriosclerosis, reocclusion following thrombolysis, cardiovascular

          polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques to restore normal activity of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and agains activity. ABG00010-ABG30377 represent novel human
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 diseases, some forms of diabetes and neoplastic disease including metastasis conditions. The products can also be used to promote cellular adhesion, e.g. in nerve regeneration, wound healing or prosthetic implantation. The products can also be used for detection, purification, diagnosis and screening assays.
                                                                                                                                                                                                                     The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromo and gene mapping, and in recombinant production of (II). The
                                                                                                                                                                                                                                                                                                                                                New isolated polynucleotide and encoded polypeptides, useful diagnostics, forensics, gene mapping, identification of mutat responsible for genetic disorders or other traits and to asset the disorders or other traits.

Protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The gene can be used to generate fusion proteins by linking to the gene to a human immunoglobulin Fc portion (e.g. AAV59502) for increasing the stability of the fused protein as compared to the human protein only. The invention relates to 186 novel genes and their fragments (nucleic acid sequences: AAV59511-V59812; amino acid sequences AAW74731-W75026) which are useful for preventing, treating or ameliorating medical conditions e.g. by protein or gene therapy. Also, pathological conditions can be diagnosed by determining the amount of the new polypeptides in a sample or by determining the presence of mutations in the new polynucleotides. Specific uses are described for each of the 186 polynucleotides, based on which issues they are most highly expressed in
                                                                                                                                                                                                                                                                                                           Plant; D-like cyclin inhibitor gene; BRO4; hyperplastic; variant; growth rate; dividing cells; inactivation; protoplast; seed;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        This sequence represents a secreted human protein encoded by the nucleic acid molecule designated Gene 176 from the human cDNA clone HFTBR48 (deposited as clone ATCC 97904 and ATCC 209050).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       New isolated human genes and the secreted polypeptide(s) they encode - useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders

                                                                                                                                                                                                                                                          sequence is homologous to a sequence present in a D-like cyclin inhibitor gene and when integrated at the corresponding locus, functionally inactivates plant D-like cyclin inhibitor protein expression. The BRO4 coding sequence may be used to produce a hyperplastic variant plant, increase the growth rate of a plant, or increase the proportion of dividing cells in a plant cell population, relative to a wild-type plant, by functionally inactivating the expression of a plant D-like cyclin inhibitor gene in a plant. BRO4 is useful for increasing the proportion of dividing cells in a plant cell population comprising protoplast, seeds, root cells, meristem cells or leaf cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                        a yeast two hybrid screen. The BRO2 protein was found to contain seven amino acid sequence cyclin binding domain similar to that encoding this BRO1, BRO3 and BRO4 (See also AAB47005-6). The DNA encoding this

          The invention relates to 2175 novel human ovarian antigens (ABP41054-ABP43228) and to cDNAs encoding them (ABQ54131-ABQ56305), and also encompasses polypeptides 90% identical and polynucleotides 95% identical to the sequences of the invention. The invention additionally relates to recombinant vectors and host cells comprising human ovarian antigen polynucleotides, antibodies against human ovarian antigens, and the use of ovarian antigen polynucleotides and polypeptides in diagnosing, treating, prognosing or preventing various ovary and/or breast-related disorders. Such conditions include ovarian cancer and breast cancer, and

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               p-genital mucous membranes, and shows a low virulence. Of the eight theins encoded by the plasmid, seven are encoded by the sense strand the eighth is encoded by the complementary strand. These proteins be used as antigens for the preparation of poly- and mono-clonal bodies to be used in diagnostics. The antigens can also be used the formulation of vaccines against infections due to CT.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   CC shock syndrome), inflammatory conditions (e.g., mastitis, cophoritis and CC vaginitis), immune disorders (e.g., congenital and acquired cC immunedeficiencies, autoimmune cophoritis, systemic lupus erythematosus), immuned disorders (e.g., congenital and acquired cC immunedeficiencies, autoimmune cophoritis, systemic lupus erythematosus), in congenital disorders, cc immunedeficiencies, autoimmune cophoritis, systemic lupus erythematosus), in congenital disorders, congenital disorders, congenital disorders, congenital disorders, congenital disorders (cc and urinary system disorders. Ovarian antigen polypeptides and cc polynucleotides may also be used in screening for compounds which cc modulate ovarian antigen expression or activity. The polynucleotides may further be used for gene therapy, chromosome mapping, in the cc identification of individuals and in forensic analysis, and the cc useful in disease diagnosis, drug targeting and phenotyping. The present sequence represents a human ovarian antigen of the invention.

CC sequence represents a human ovarian antigen of the invention.

CC specification, but was obtained in electronic format directly from WIPO

XYL I and XYL II retain their activity at high temperatures (e.g. 70 deg. C) and at low pHs (e.g. 4.0), conditions which temperatures (e.g. 70 deg. C) and at low pHs (e.g. 4.0), conditions which temperature most known xylanases. Enzymes that remain active in these conditions may be used in industrial processes that are carried out at high temperature and low pH to speed up other, non-enzymatic reactions, minimising costs, energy requirements, and the risk of pollution, (e.g. enzymes XYL I and XYL II can be used to facilitate chlorine bleaching of paper pulp which is carried out in hot, acidic conditions). Pretreatment with XYL I and XYL II, allows the bleaching agents to penetrate better, to remove lighth from the pulp and 'bleach' the colouration from it. This means smaller quantities of the agents can be used to produce the same or a better result. Also, NOTE: This patent is an equivalent to FI9503640.
                                                                                                                                                         New acidophilic and thermostable xylanase enzymes from Actinomadura sp. FC7 - useful for treating plant biomass, especially paper and wood pulp, to degrade hemicallulose and hydrolyse xylan
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Streptomyces

This means that the paper and pulp industry to improve the efficiency of the bleaching process by degrading the structure of the material.

CC XYL I and XYL II may also be used to treat feed, by degrading a constituent of the material in the paper activity at high temperatures (e.g., 70 deg, C) and at low phs (e.g. 4.0), conditions which tend to denature most known xylanases.

CC Enzymes that remain active in these conditions may be used in industrial processes that are carried out at high temperature and low ph to speed up other, non-enzymatic reactions, minimising costs, energy requirements, and the risk of pollution, (e.g. enzymes XYL I and XYL II can be used to caidic conditions). Pretreatment with XYL I and XYL II, allows the collocating agents to penetrate better, to remove lignin from the pulp and bleaching degrats can be used to produce the same or a better result. Also, collocation is an equivalent to Fi9503640.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      밁
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Qy

xylanase enzymes (XYL I and XYL II) from Actinomadura sp. FC7 which retain their activity under harsh industrial conditions (e.g. high temperature or wide pH ranges) and may be secreted by recombinant host cells, to treat plant biomass. Xylanases XYL I and XYL II are part or

describes the use of novel acidophilic and thermostable

ells, to treat plant biomass. Xylanases XYL I and large group of hemicellulase enzymes and function

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 CC beta-1,4 bonds within the xylosic chain of xylan (a polymer of D-xylose CC residues that is a major constituent of hemicellulose). This means that CC they may be used in the paper and pulp industry to improve the efficiency of the bleaching process by degrading the structure of the material.

CC XYL I and XYL II may also be used to treat feed, by degrading a CC substrate with a high beta-glucan or cellulose content. XYL I and XYL II contains a conditions which tend to denature most known xylanases.

CE processes that remain active in these conditions may be used in industrial processes that remain active in these conditions may be used in industrial processes that are carried out at high temperature and low pH to speed up context, non-enzymatic reactions, minimising costs, energy requirements, cand the risk of pollution, (e.g. enzymes XYL I and XYL II can be used to conditions). Pretreatment with XYL I and XYL II can be used to bleaching agents to penetrate better, to remove lignin from the pulp and bleaching agents to penetrate better, to remove lignin from the pulp and conditions can be used to produce the same or a better result. Also, conditions can be used to produce the same or a better result. Also, conditions and equivalent to FI9503640.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Query Match
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Matches
The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The
                                                                                                                                                                                                                 New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess biodiversity
                                                                                                                                                                                                                                                                                                                                                                   WPI; 2001-639362/73.

                                                                                                                                                                     밁
                                                                                                                                                                                                 polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques (II). (II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. ABG00010-ABG30377 represent novel human diagnostic amino acid sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fire, wipo.int/pub/published_pct_sequences.
